11

Community Engagement Frontier

K. A. Assamagan, B. Quinn

11.1 Introduction

In Snowmass 2013, community engagement covered only physics Communication, Education and Outreach [1]. The scope was extended during Snowmass 2021 to include several topical groups, namely Applications and Industry, Career Pipeline and Development, Diversity, Equity and Inclusion, Physics Education, Public Education and Outreach, Public Policy and Government Engagement, and Environmental and Societal Impacts. The objective is to improve and sustain strategic engagements with our communities in order to draw support for and strengthen the field of particle physics, while playing key roles in serving those communities. These engagements take well-coordinated efforts in many areas where the communities of experts and non-experts can understand and communicate our field’s value, maximize its impact on global socioeconomic development, and open its doors to broader participation. The efforts aim to support: practical applications of research in particle physics and technology transfers to industries, career development and job opportunities for young scientists, encouragement and inclusion of diverse physicists to reflect the diversity in our communities, advances in physics education to produce talented and qualified students, engagement with the public to share in the essence and importance of physics research, partnerships with governments and policymakers to grow the scientific enterprise, and improvements in the ways that our field affects the environment and society in which we live.

The aforementioned topics, developed within the Community Engagement Frontier (CEF), are relevant to all the other frontiers of Snowmass 2021—they are cross-cutting topics or issues for all the physics frontiers. About one hundred letters of interest (LOI) were received on these topics. These LOI were condensed into thirty-five contributed papers, the details of which are mentioned in the topical group reports here. In addition to the LOI, inputs to contributed papers came from town hall discussions, group meetings, expert speaker invitations, workshops and surveys.

In Sections 11.2-11.8, we summarize the work of each topical group and propose specific recommendations to improve the ways our community engages in these areas. The shared experiences and overlapping interests among the various topical groups and other frontiers have informed the development and incorporation of strategies and recommendations articulated in a set of overarching goals for HEP engagement with five interrelated communities: HEP itself, K-postdoc education, private industry, government policy, and the broader society (Figure 11-1). These overall CEF goals organized by target community for engagement, along with references to the specific topical group recommendations that they encompass, are listed below.
Figure 11-1. Five interrelated communities targeted for HEP engagement.

11.1.1 Overall Community Engagement Frontier Goals

HEP Internal Engagement

- The HEP community should institute a broad array of practices and programs to encourage stronger participation in HEP collaborations by faculty and students from non-R1 academic institutions. (CEF02 4.1-4.3,5.1-5.3,6.1-6.4; CEF04 6)

- HEP communities should employ the use of robust strategic planning procedures, including a full re-envisioning of science workplace norms and culture to prioritize and addresses community-related issues. (CEF03 F1,C1)

- HEP communities should implement new modes of community organizing and decision-making that promote agency and leadership from all stakeholders within the scientific community. (CEF03 F2,C2)

- HEP communities should engage in partnership with scholars, professionals, and other experts in several disciplines, including but not limited to anti-racism, critical race theory, and social science. (CEF03 F3,C3)

- The HEP community should enact structural changes to enable better public engagement. (CEF05 1)

- Internal communication within HEP concerning program planning and funding, and communication channels with the funding agencies should be improved. (CEF06 1,2,3,5)

- HEP impacts on climate change should be addressed and mitigated by DOE project policies and individual community member actions. (CEF07 1-6,8)
11.1 Introduction

- The HEP community should re-evaluate Snowmass organization and infrastructure as it relates to community engagement. (CEF03 C4.1,4.2; CEF05 2)

**Education**

- Funding agencies, national laboratories and universities should work to provide more education and career opportunities for engineering and industry-focused research within HEP. (CEF01 5,6; CEF02 1.1,1.4,3.1,3.3; CEF04 7)

- HEP academia should work with K-12 teachers and students to create supportive local communities to nurture student interest in math and science. (CEF04 1)

- University departments should update existing degree programs and create new ones to match better the skills needed and career opportunities required in today’s HEP and related fields. (CEF02 5.4; CEF04 2-5)

- Pre-university and university programs for international student collaboration should be expanded and supported. (CEF04 8,9)

**Industry**

- Funding agencies and the national laboratories should implement policies and programs to foster technology transfer. (CEF01 1,2; CEF02 3.2)

- Laboratories and universities should pursue targeted partnerships with early stage scaleup companies on HEP projects. (CEF01 3.4)

- Funding agencies should update and/or institute policies and collaborative programs directed to specific technologies, including: with large microelectronics companies to expand HEP community access to CAD/EDA tools, with R&D projects to clinically realize the curative potential of FLASH-RT, and with industrial firms to nurture the US accelerator technology base. (CEF01 7-13)

- The HEP community should strengthen ties with industry and other fields by developing effective alumni networking tools and programs. (CEF02 1.5,2.1-2.3)

**Policy**

- The HEP users groups and DPF should provide the resources for continued growth and sustainability of the annual HEP Congressional advocacy effort. (CEF06 2-2.2,2.4-2.6,3)

- The users groups, DPF, laboratories and universities should work to expand advocacy to the federal executive branch and state and local governments. (CEF06 6,7)

- HEP should establish a group to work with other science and physics societies on advocacy for non-HEP funding issues. (CEF06 4)
Society

- HEP should build lasting relationships with the full breadth of all of our supporting communities that are based on real two-way partnerships rather than transactional interactions. (CEF05 3; CEF07 7.9-13)

- HEP should build synergistic collaborations with the non-proliferation community that draw on a broader spectrum of funding sources for work on technologies related to nuclear non-proliferation. (CEF07 14-16)

11.1.2 Participation and Implementation

Throughout the Snowmass 2021 process, there has been relatively low participation in Community Engagement Frontier efforts. This is true although it is generally agreed that CEF topics are cross cutting, i.e. they affect the entire community to various degrees, and thus are important to be addressed. The vast majority of CEF work was carried out by the small number of frontier and topical group conveners, with only a few additional dedicated community members making significant contributions. Indeed, many contributed paper study groups were led and conducted by the CEF topical group conveners themselves through to publications of these papers, because of low community involvement. Instead of CEF being a cross-cutting frontier with significant participation, it became an isolated set of activities—in spite of frontier liaisons—carried out by a relatively small group of people; almost all of whom are also physicists with interest in the other “physics” frontiers. These dedicated volunteers were largely prevented from participating in the Snowmass physics frontiers at significant levels due to the burden placed on them by the lack of participation in CEF by the majority of their HEP colleagues. As a result, all of the CEF topical group conveners sacrificed career advancement opportunities in order to carry out the work necessary for the health of the field on behalf of the entire HEP community. Various reasons have been suggested to explain low involvement in CEF, e.g. lack of time or the fact that career progression depends on the quality of research output rather than community engagement effort. Surveys done in Refs. [2] cite also CEF05 report offer further insights into the low participation issue. It is also possible that Snowmass is the wrong time for the community to focus on developing a plan for addressing CEF issues. Certainly, individuals’ concerns for time management and maximizing the potential for career development are heightened during the high-stakes planning and decision-making of Snowmass. Snowmass may be the one time that presents the greatest barriers to a large fraction of the community choosing to participate in CEF, so perhaps this should be the last time that CEF is a part of Snowmass. Whatever the reasons, the HEP community both corporately through structural change and as individuals through personal reflection must decide that everyone’s participation in CEF issues is required for the field to become healthy and grow. We can no longer rely on a small number of colleagues to shoulder the full burden of this work to the detriment of their own careers. Our field simply will not survive otherwise.

If the field of HEP does decide that CEF issues are worth addressing, and furthermore commit to doing so, then a plan of implementation of CEF recommendations must be developed. In the past, the responsibility for guiding the selection and implementation of Snowmass recommendations has been wholly delegated to the Particle Physics Project Prioritization Panel (P5). This arrangement has worked exceedingly well over the last 8 years for implementing a consensus plan of HEP projects. However, experience has shown that the current P5 mandate and makeup is not suited to adequately shepherd other areas of the HEP enterprise, including community engagement issues. For example, Snowmass 2013 included the Community, Education, and Outreach Frontier, which produced a report that made several recommendations [1]. Neither P5 nor any other HEP organization or leaders took ownership of those issues to ensure that recommendations...
from that frontier were implemented. As a result, despite the fact that individual people and institutions in our community have made efforts in these areas in the last decade, little overall progress on these recommendations has been realized since the last Snowmass.

To avoid a similar fate for Snowmass 2022 CEF recommendations, US HEP must establish a structure by which designated entities are given ownership of and responsibility for ensuring that CEF recommendations are implemented and monitored for progress. One such possibility is simply expanding the P5 charge to encompass CEF issues. It is not clear that is the most appropriate solution, though. P5 was explicitly designed to effectively prioritize (largely experimental) HEP projects. It may be that P5 is not ideally situated in the HEP ecosystem, or appropriately staffed to evaluate, choose, and monitor the progress of CEF initiatives. Considering the five engaged communities around which the CEF goals are organized, it could be that The American Physical Society Division of Particle and Fields (DPF) is best positioned to shepherd the internally-focused recommendations for HEP because that organization is most representative of the entire field’s membership. Perhaps a group formed in partnership between DPF, the funding agencies, and the laboratories is needed to manage engagements with industry. Universities Research Association’s membership consisting of university administrations and its role in connecting academia with laboratories could make it best suited as a sponsoring organization for a team to work towards implementation of education initiatives. Almost certainly, the elected representative user groups that have led HEP funding advocacy efforts for decades should form the core of any new entity formed to expand policy efforts. As the focal points for public engagement with HEP, the laboratories themselves may be the ideal choice to manage the recommended programs directed at the broader society. All of these stakeholders should begin the conversation that must lead to an agreed structure for taking responsibility for implementing CEF recommendations. If this does not happen, then we face another decade of no progress on CEF issues in the HEP community.

The rest of this report describes the impressive amount of high-quality work that a small number of your colleagues accomplished on your behalf. We hope that as you read and consider this content you will be convinced of two propositions:

1. It is critical that we as individuals agree on the importance of all working together to address CEF issues in HEP.

2. A structure within HEP for taking ownership and responsibility for implementing CEF recommendations and monitoring their progress must be developed.

If we as a field can make these two ideas a reality, then US HEP will be much stronger and healthier by the time we gather for the next Snowmass process.

11.2 CEF01: Applications and Industry

The charge for the topical group CEF01, Applications and Industry, is to develop strategies to strengthen HEP/Industry relationships in both directions, i.e. forming more partnerships to draw on industry expertise to further HEP goals and building on programs to facilitate transfer of HEP technologies/techniques for use in the broader society. This group considered the relationship between HEP laboratories, universities, and industrial stakeholders. In particular, two objectives were pursued: (1) how to maximize the HEP-funded research outcomes which benefit practical applications, and (2) how to engage industry to develop the technology support base for long-term HEP programs.
In order to expand the discovery reach of experimental high energy physics, innovations in a variety of
technologies are required to push operational and measurement tools and techniques to ever-higher levels
of spatial and temporal precision. Not only do these advances propel scientific discovery, but they also
enhance industrial capabilities to deliver novel and powerful applications to the benefit of the broader
society. Strong development relationships between laboratories and universities of the HEP community
and small to large scale tech companies in the industrial community are key for building an efficient and
sustainable ecosystem for advancing technologies such as accelerators, microelectronics, artificial intelligence,
and quantum information.

With individual modern HEP experiments characterized by industrial scales such as detectors with more
than 1 billion sensors, 70 kilotons of liquid argon, or data rates equivalent to the entire North American
internet traffic, it is obvious that a robust and diverse array of industry partners is necessary for HEP to
mount almost any project in its portfolio. On the other hand, the engineering design benchmarks needed to
handle the extreme radiation, cryogenic, low power, and inaccessible operating environments of HEP projects
often exceed those typically found in industry by orders of magnitude. Multidisciplinary technology design
and production partnerships for HEP between national labs, academia, and industry accelerates lab to fab
innovation, prototyping to scale, technology maturation, spin-off development, and rapid adoption.

Those working in CEF01 produced six contributed papers examining three different modes of collaborative
partnership, and cooperation on three different specific areas of technology.

- Programs enabling deep technology transfer from national labs [3];
- Technology transfer with scaleups [];
- Application-driven engagement with universities, synergies with other funding agencies [4];
- Big industry engagement to benefit HEP: microelectronics support from large CAD companies [5];
- Transformative technology for FLASH radiation therapy [6];
- Nurturing the industrial accelerator technology base in the US [7];

The following sections summarize the ideas and set forth the recommendations arising from each of those
papers, and detailed in the CEF01 Topical Group Report [].

11.2.1 Programs Enabling Deep Tech Transfer from National Labs

To achieve the scientific goals of HEP projects, DOE national laboratories and the experiments they host
require innovative ideas and at-scale prototyping for novel technologies. These projects must bridge the
academy’s drive to push beyond state-of-the-art capabilities to industry’s forte in quality control and
reliability. Experiments and industry collaborating to move these novel technologies from ideas to robust
and cost-effective mid-scale manufacturing, can put industry on a path to commercial production. However,
a proper environment is necessary to nurture this laboratory to fabrication (or lab to fab) technology transfer
process in a manner that can sustain spin-off development and startup ventures over the long term. Several
recommendations are made to develop an effective technology transfer ecosystem or for HEP at the national
labs.
CEF01 Recommendation 1 – DOE should implement specific policy changes to foster technology transfer.

CEF01 Recommendation 1.1 – Align inventor royalty distribution policy across DOE. Inventor royalty distribution policy should be consistent across the DOE complex. A proposed royalty distribution might entail 34% to the inventor(s), 33% to the inventor’s Division, and 33% to the Laboratory. The royalty portion distributed to the Laboratory and/or Division might be used to support HEP opportunities, consortium investments, rewards programs, technology maturation to further the technology transfer mission, and innovation/entrepreneurship educational opportunities for Laboratory staff.

CEF01 Recommendation 1.2 – Engage with partnership intermediaries to accelerate commercialization. Many national laboratories supporting HEP facilities have limited resources to support Technology Transfer (TT) and commercialization. A Partnership Intermediary (PI) is a non-profit entity with specialized skills that can assist federal agencies and laboratories in TT and commercialization functions. Past pilot programs in the Department of Energy Office of Technology Transitions have shown promise in assessing technologies for market pull, marketing HEP-related technologies, and matchmaking technologies at national labs with entrepreneurs in private industry.
CEF01 Recommendation 1.3 – Extending Other Transaction (OT) authority. An Other Transaction (OT) is a special mechanism used by federal agencies for obtaining or advancing R&D or prototypes. The government’s procurement regulations and certain procurement statutes do not apply to OTs; thus, OTA gives agencies the requisite flexibility to develop agreements tailored to a particular engagement with companies unwilling or unable to comply with the government’s procurement regulations. While the Energy Policy Act of 2005 granted OTA to DOE at the agency level, it failed to authorize the labs to use it. OTA could be a more effective model for technology transition if driven at the local laboratory level, where the interaction with industry is vital for success. OTA is an ideal mechanism to help labs better identify market needs and become more valuable to the private sector.

CEF01 Recommendation 2 – National laboratories should establish training and partnership programs to encourage participation in technology transfer activity.

CEF01 Recommendation 2.1 – Increase technology transfer educational opportunities targeted to HEP researchers. Providing educational opportunities to ramp up to an I-Corps level of engagement for high-energy physics researchers would be a great opportunity to provide the building blocks to researchers to enable more engagement in capturing innovations. Discussions on the types of intellectual property (ex. patents, copyrights), rights afforded to researchers from their innovations, and the mechanisms to engage with industry to advance their technologies would provide valuable resources and perspectives.

CEF01 Recommendation 2.2 – Establish an entrepreneurial leave program. An Entrepreneurial Leave Program (ELP) allows employees to take a leave of absence or separation from the laboratory in order to start or join a new company. ELPs encourage startup activities by reducing the risks faced by the employee entrepreneur. Some elements of an ELP may include business preparation/training, a means for licensing laboratory IP, continuity of health benefits during leave, and a mechanism for returning to work. ELPs are not implemented consistently across the DOE complex; some laboratories have ELPs while others do not.

CEF01 Recommendation 2.3 – Promote public-private partnerships for accelerating HEP innovations. Specifically, in technology areas such as accelerators, US federal program managers have proposed developing public-private partnerships to foster and support small and large technology businesses who collaborate with the laboratories and serve as commercialization partners for critical technologies developed as part of facilities and experiments in high-energy physics. These public-private partnerships could serve as both advocacy and economic development entities for high-energy physics derived technologies, as well as matchmakers that aid companies and laboratories in forming collaborations, which lead to commercialization outcomes.
11.2 CEF01: Applications and Industry

11.2.2 Technology transfer with Scaleups

Need some text here to define and describe scaleups.

CEF01 Recommendation 3 – Laboratories should host Laboratory Discovery Days for scaleups. National Laboratory business development (BD) efforts with larger companies involve hosting “Discovery Days”. Product leads and problem owners from companies are invited to visit the lab and have discussions with technical/domain experts. Success is measured in number of Discovery Days that convert to projects. Similar Discovery Days to host scaleups at the lab to deep dive into their technology roadmap need to be adopted.

CEF01 Recommendation 4 – Leverage university relationships to connect with Venture Capitalists (VCs). Some VCs such as ARCH look for strong scientific founders who can help their companies at early stages and drive getting an exclusive license from the university, which is not as easy to get as from a National Lab. The university model, which allows staff members to spend one day a week on external projects, helps facilitate such work. It is usually beneficial if the university staff have a large lab and students who can get involved.

11.2.3 Application-driven engagement with universities, synergies with other funding agencies

Laboratory-university HEP partnerships have been very successful, but within the United States have been limited to university physics departments. However, as technology advances, the level of engineering design for accelerators and detectors keeps growing and close collaboration between the labs and university engineering departments is becoming more important. Interactions between the labs and engineering departments are opportunist and transactional rather than systematic and synergistic like with physics departments. In contrast to Europe, the US HEP community does not have the programmatic ability to directly support engineering research in the academy. In areas such as computation and microelectronics, upcoming HEP projects will require significant amounts of engineering R&D. This activity and those conducting it need to be considered integral to the HEP community. In addition, HEP labs need to partner with universities to produce a technology workforce.
CEF01 Recommendation 5 – The DOE Office of HEP should engage directly with engineering departments.

CEF01 Recommendation 5.1 – Create more explicit representation of engineering partnerships in established listings of funding opportunities. Clearly label support for HEP-Engineering effort, such as fellowships reserved for engineering graduate students, a class of projects designated as science-engineering partnership, where the project application requires dedicated components reserved for both science and engineering (similar to NSF projects where a research and an education component are requested to be described individually).

CEF01 Recommendation 5.2 – Expand engineering collaborations across DOE and with other agencies (e.g. NASA, NSF, DOD).
CEF01 Recommendation 6 – HEP labs and universities should work together to develop intentional pipelines of engineers for the HEP workforce from undergraduate students to professional ranks. A possible pipeline could be as follows. HEP labs recruit undergrads for internships through partner universities ⇒ students are trained in the setups and topics the HEP lab prioritizes ⇒ successful undergraduate students are channeled to graduate programs across a network of partner universities ⇒ universities recruit these students into engineering PhD programs ⇒ co-advising models are used to mentor these students by both an engineering professor and a HEP scientist ⇒ feed the students back into the HEP workforce.

CEF01 Recommendation 6.1 – Universities should welcome input from HEP labs on recruiting the next generation of graduate students from the cohort of international students with interdisciplinary (physics, science, and engineering) backgrounds.

CEF01 Recommendation 6.2 – Universities should establish joint academic appointments for HEP lab and industry scientists within engineering departments. These HEP scientists could then also be thesis advisors and thesis committee members of students.

CEF01 Recommendation 6.3 – HEP lab members should promote engineering students for awards, such as the URA Visiting Scholar award. Often times, engineering faculty and engineering PhD students are not aware of all opportunities that exist within the HEP and national lab ecosystems. Guidance from HEP scientists will help lift entry barriers for them.

11.2.4 Big Industry Engagement to Benefit HEP: Microelectronics Support from Large CAD Companies

Only a few large companies have both deep expertise in modern microelectronics and access to CAD-EDA tools. In addition, ASICs designed for the extreme environment requirements characteristic of HEP have little market value for those large companies. Therefore, microelectronics for HEP tend to be designed by partnerships of national lab and university personnel. However, these collaborations typically do not have access to the suite of CAD tools due to complicated and expensive licensing frameworks, which are negotiated independently by each DOE lab. The DOE needs to develop a centralized licensing framework with CAD vendors to bring economy of scale and flexibility for each lab to procure the set of tools required for their own projects and teams. There are motivating benefits to the microelectronic industry to pursue this business relationship with HEP. Extreme environment microelectronics make up little of the commercial market, but that segment is growing, particularly for QI and AI applications. DOE science users are typically good sources of feedback on cutting edge uses of advanced CAD-EDA tools, and also develop the talent pool for
the microelectronics workforce. The following recommendations arose from DOE HEP hosted meetings with several major CAD-EAD companies.

<table>
<thead>
<tr>
<th><strong>CEF01 Recommendation 7</strong> – DOE should consider creating a Collaborative Innovation Hub scoped for cooperative team shared access to CAD/EDA tools, training, and support.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th><strong>CEF01 Recommendation 7.1</strong> – Establish a dedicated cloud-based communal participation platform between academia, DOE national labs, and CAD/EDA companies.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th><strong>CEF01 Recommendation 7.2</strong> – Leverage successful solution frameworks (e.g. DARPA Innovation Package, Europractice IC Service, DOD Cloud Access Rights) through the efficiencies of shared access.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th><strong>CEF01 Recommendation 8</strong> – Incorporate some aspects of CAD/EDA companies’ academia policies for research projects at national labs, to create a new class of research licenses.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th><strong>CEF01 Recommendation 8.1</strong> – The solutions should keep intact the premise of CAD/EDA companies’ contributions with special arrangements for commercializing research results.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th><strong>CEF01 Recommendation 8.2</strong> – Leverage the academic network to cultivate talent to advance and promote innovations in semiconductor technologies.</th>
</tr>
</thead>
</table>

### 11.2.5 Transformative Technology for FLASH Radiation Therapy

Radiation therapy (RT) cancer treatment has arguably delivered the greatest societal impact of any particle accelerator application, and a large share of accelerator science has been enabled through HEP research support. FLASH radiation therapy (FLASH-RT) is a recent development in which ultra-high doses of therapeutic radiation are delivered in less than a second. Experiments show that FLASH-RT effectively destroying tumors while almost completely sparing normal tissue. However, there are technical difficulties in the development of a clinically-safe delivery system, and the accelerator capabilities within the HEP community will be needed to resolve the issues.
Most R&D for FLASH has been carried out using 4-6 MeV electrons from clinical linacs, producing strong results. Photon beam FLASH studies using synchrotron radiation and X-ray tubes have yielded mixed results. Some work has also been done with 230-250 MeV shoot-through beam protons from CW and isocyclotrons. Limitations include intensity requirements preventing the use of energy degraders for proton beams, and synchrotrons lacking the intensity of ion beams required for FLASH.

CEF01 Recommendation 9 – The HEP community should carry out a broad R&D program to clinically realize the curative potential of FLASH-RT with different radiation modalities. Among the relevant projects are:

- The Advanced Compact Carbon Ion Linac (ACCIL) is a program initiated by the Argonne National Laboratory to develop up to 1 kHz repetition rate, compact proton linac capable to deliver FLASH-RT doses.;
- Scaling Fixed Field Gradient Accelerators (FFGA) are synchro-cyclotron style proton accelerators, which can operate at high repetition rates and high currents consistent with FLASH needs; most of the current R&D programs on scaling FFGAs are performed by Japanese research groups.;
- Non-scaling FFGAs are particularly well suited for accelerating other ion species (i.e. carbon), and there is a pilot facility under construction at the National Particle Beam Therapy Center (Waco, TX).;
- Laser-driven accelerators can deliver very large doses of protons or high energy electrons from a compact source (both scenarios are potentially of interest to FLASH-RT). The bulk of US program is centered at the LBNL BELLA laboratory.;
- The pulsed power based linear induction accelerator (LIA) using a multilayered bremsstrahlung conversion target also represent very promising technology in meeting FLASH-RT requirements, and there is a pilot program underway at LLNL.;
- Multiple groups are also working to develop FLASH-capable X-ray systems, including the ROAD initiative by UCLA/RadiaBeam, and PHASER initiative by SLAC/Tibaray.;
- One potential application, which can take advantage of the recent interest by HEP community towards novel cold RF technology, is a compact cold-RF Very High Energy Electron (VHEE) radiotherapy system, with relevant R&D programs initiated at SLAC and at CERN.;

11.2.6 Nurturing the Industrial Accelerator Technology Base in the US

It is widely perceived by the HEP accelerator community that accelerator technology transfer to US industry is not a high priority. US HEP commonly develops state-of-the-art accelerator technology, then buys it back later from international firms for domestic projects. Europe and Asia have nurtured vibrant accelerator industrial bases, leaving US firms at a competitive disadvantage. This has resulted in a US accelerator
community plagued by increased costs, insufficient component availability, dependence on foreign sources, small talent pool of technical personnel and low societal recognition of accelerator science benefits.

Although industrial firms play critical roles in the scientific enterprise, important US accelerator companies have struggled to survive. Pioneers in SCRF and undulator technology enjoyed initial success, but failed due to the inability to sustain support from DOE research, leading to the loss of capital and unique expertise. Several regulatory and policy recommendations are suggested to build a competitive domestic industrial base for accelerator technology.

CEF01 Recommendation 10 – Modify the US Small Business Innovation Research (SBIR/STTR) program to nurture these small businesses across the “Valley of Death”. One improvement would be to more closely align the program technical topics to the future procurement needs of the labs, and encourage the labs benefiting from the SBIR funded work to maintain the momentum and work with the industry beyond the SBIR funded phase.

CEF01 Recommendation 11 – Support specialized industrial vendors by implementing directed “knowledge transfer” programs. Recent decades saw a proliferation of National Laboratories based commercialization centers built around the technology transfer activities. Yet, few can report successes and, in general the idea of technology transfer through funding the commercialization activities by the labs is counterproductive for the purposes of building the industrial vendors base. We believe it would be more beneficial to deemphasize technology transfer as a means of supporting the labs, and emphasize knowledge transfer as a means of supporting motivated businesses to expand capabilities of interest to the DOE programs.

CEF01 Recommendation 12 – DOE should establish a method to identify key technologies that will be needed in a decade time frame and create new channels of direct funding to the qualified industrial enterprises to develop expertise, infrastructure, and capacity to meet such needs. It is also equally important to be able to help sustaining the companies that have already achieved critical capabilities.

CEF01 Recommendation 13 – Laboratories should simplify some of the procurement practices, and likewise explore various creative ways for industry and laboratories to collaborate on the prototype developments that would minimize the risks and maximize return to both sides. The accelerator community should also promote programs that facilitate direct and open communication channels between laboratory engineering and technical staff with their industrial counterparts (there are many conferences for scientists to attend and share their experiences, but not so many venues are available to technicians and engineers whose skills are essential and irreplaceable in our field).
11.3 CEF02: Career Pipeline and Development

This working group is not simply about making early career scientists aware of different opportunities, but also changing the culture of HEP career paths. It aims to identify and encourage career opportunities for high energy physicists in both academia and industry, and to identify useful partnership options between HEP and industry. Smoother pipelines between different types of employment are critical for the success of HEP trainees in the future. One objective is to promote the skill development of physics graduates and young researchers and encourage career direction-based scientific majors and skills.

Thirty-two LOI were submitted to this working group and were condensed into three contributed paper topics, namely:

1. Facilitating Non-HEP Career Transition;
2. Enhancing HEP research in predominantly undergraduate institutions and community colleges;
3. Tackling diversity and inclusiveness in HEP.

Topic (3) was integrated to and developed in the topical group on diversity, equity and inclusion in Section 11.4. Ultimately, two contributed papers on topics (1) and (2) were prepared and presented in Refs. [8, 9]. Considering that there are fewer academic positions than job seekers, many degree holders will eventually seek jobs outside HEP, where, in sectors such as industry, there are demands for skills acquired in HEP training, e.g. data science or machine learning. However, organized guidance—developed through engagements between the HEP community and the alumni that have already transited out of HEP—is needed to help with non-HEP career transitions [8]. Another career trajectory may to employments at predominantly undergraduate institutions (PUI) and community colleges (CC), with high teaching loads and lack of support for research. PUI and CC can serve as pipelines to improve diversity and under-representation in HEP, by facilitating participation of faculties and students at PUI and CC in HEP activities [9].

11.3.1 Facilitating Non-HEP Career Transitions

It is noted in Section 2 of Ref. [8] that more that two-third of trained physicists will eventually transitions to employments in private or government sectors, collectively referred to as "industry"; moves to the industry sector may occur at various stages of HEP career evolution and proper planning is needed to facilitate the transition. A survey conducted by the Snowmass Early Career (SEC) physicists included questions about career pipeline and development [2], to offer insights on existing efforts, support, networking, preparation and attitude towards career change and alumni participation or eventual return to HEP. Details about the SEC survey and findings related to career pipelines and development are documented in Refs. [2, 8]. We recall here the recommendations:

CEF02 Recommendation 1.1 – Supervisors and mentors should be directly involved in planning the career of their mentees early on. This career plan should not be based on the desires of the mentor but the skills and interest of the mentee. A commensurate effort in the job search process is also needed.
CEF02 Recommendation 1.2 – Supervisors should allow a certain fraction of working time for their mentees to pursue opportunities and preparation activities for a possible industry career.

CEF02 Recommendation 1.3 – HEP experiments, laboratories, or university departments should provide training for supervisors so that they can better understand and be more sensitive to the needs of their mentees in terms of their career goals and preparation.

CEF02 Recommendation 1.4 – HEP experiments and/or laboratories should provide workshops on industry job preparation: translating HEP skills and examples to industry language, converting CVs to resumes suitable for different fields, finding successful job search phrases (for example, “Engineer” or “Data Scientist” as opposed to “Physicist”). This will be most successful when paired with the recommendations below for deepening connections with HEP alumni.

CEF02 Recommendation 1.5 – HEP experiments and/or laboratories should develop innovative opportunities for networking with HEP alumni in various fields to strengthen industry job search success. Alumni are more than willing and happy to respond and engage. This will be most successful when paired with the recommendations below for deepening connections with HEP alumni.

The survey revealed that about 50% of respondents tried to find jobs in their field before moving on to opportunities in industry; they exited at student or post-doctoral levels and went to STEM-related responsibilities outside academia. These transitions were mostly facilitated through networking; but the difficult step is to leave at a relatively late stage in academic. It is challenging to return to HEP but alumni are open to joint projects, and this can help strengthen partnerships between HEP and industry [8]:

CEF02 Recommendation 2.1 – Supervisors and mentors should actively communicate with alumni and highlight their experiences for current students and postdocs, to normalize the reality of transitioning to an industry career.

CEF02 Recommendation 2.2 – The US HEP community should develop tools and portals for connecting with alumni. Existing programs for networking with alumni like at CERN must be studied and adapted. This effort should be supported and strengthened by funding agencies by dedicating a small amount of continuous funding to support technical and personnel staff that
can organise and build a framework that can serve as a hub to facilitate process of networking with alumni. A DOE lab would be an ideal place to host this effort, like Fermilab, which is a hub for US particle physics.

**CEF02 Recommendation 2.3** – HEP experiments and laboratories should take creative steps to reverse “brain drain” from HEP by exploring mechanisms for collaboration with alumni on HEP projects.

- Alumni are a relatively low cost but very valuable asset with an abundance of experience from transitioning to an industry career. Their goodwill to contribute and strengthen ties with HEP can be tapped to facilitate industry job transitions and further the goals of both groups.
- Individual scientific collaboration can be extended to the company of the alumni itself and this can strengthen knowledge transfer from labs and universities and vice versa; and work done by HEP research can benefit companies and vice versa.

HEP training offered at universities and laboratories could be extended to industry for opportunities to apply HEP skills in a different environment and culture and this may facilitate eventual career transitions. The survey showed support to develop such HEP-industry partnerships [8]:

**CEF02 Recommendation 3.1** – HEP laboratories should create targeted internships or training programs in the areas of Accelerator Technology, Computer and Information Science, Detector and Engineering Technology, Environmental Safety and Health and Radiation Therapies. This would expand access to industry-focused training to students and postdocs who are not based at national laboratories.

**CEF02 Recommendation 3.2** – HEP laboratories should leverage existing public-private partnerships with industries like Accelerator Technologies, Computers Information Science, Detector and Engineering Technologies and also Environmental Safety to create experience for resident students and early career scientists to build skills ad connections for a future industry career.

**CEF02 Recommendation 3.3** – Funding agencies should evaluate funding rules and regulations to allow HEP students and postdocs to pursue industry-focused training that can be integrated with their core research curriculum.

**CEF02 Recommendation 3.4** – Supervisors must adopt a mindset that industry partnerships and career transitions are valuable options for their students and postdocs, and should support
their participation in training opportunities whenever possible.

11.3.2 Enhancing HEP research in predominantly under-graduate institutions and community colleges

HEP activities are carried out primarily by people at laboratories and research focused non-PUI. However, about 40% of undergraduate students in the United States are enrolled in CC where ~80% are from demographics under-represented in STEM. It is therefore important for the HEP to engage the vast community at PUI and CC which may serve as pipelines to improve diversity and under-representation in HEP. For such engagements to be productive, barriers to participation of PUI and CC faculties in HEP activities must be addressed. These barriers include heavy teaching loads, lack of guidance and research funds, lack of research infrastructure and equipment, and lack of administrative support and understanding of the regulations and requirements for successful participation in HEP—see Ref. [9] and the references therein. To address these barriers, we suggest the set of recommendations on institutional culture cite CEF02 report here:

CEF02 Recommendation 4.1 – The HEP community should encourage a global shift in perception, acknowledging that:

- Undergraduate research experiences are key to engaging a broader section of the student population.
- PUI or CC faculties have much to offer their collaborations, particularly in experiment-wide training and educational activities.

CEF02 Recommendation 4.2 – HEP experiments should offer coordinated communication from leadership to PUI administrators, extolling the features of high energy physics research alongside highlighted participation.

CEF02 Recommendation 4.3 – The HEP community should offer special sessions for PUI and CC faculty at national meetings to develop a deeper sense of community.

We also have recommendations for research funding cite CEF02 report here:

CEF02 Recommendation 5.1 – Funding agencies should strengthen participation by PUIs in HEP by allocating funds for grants from these institutions, and HEP experiments or laboratories should fund grant-writing workshops.
CEF02 Recommendation 5.2 – Funding agencies should allow course buyouts in proposals by PUI/CC faculty in order to boost productivity and establish continuity in PUI research programs.

CEF02 Recommendation 5.3 – Funding agencies, HEP experiments, and laboratories should create or support paid summer programs for PUI faculty to work at National Labs or non-PUIs, as well as research opportunities for students not enrolled at major HEP institutions.

CEF02 Recommendation 5.4 – Supervisors and HEP experiments should provide training to interested students and postdocs on US-specific research funding procedures.

Finally, we suggest the following recommendations for participation in HEP activities:

CEF02 Recommendation 6.1 – Non-PUI senior-level researchers should investigate how their groups could offer opportunities for short-term and long-term collaboration on their experiment to faculty and/or students at local PUIs.

CEF02 Recommendation 6.2 – HEP experiments must reevaluate large fixed “entry fees” per institution, if they exist. Consider implementing “light” membership forms that are low cost but not time limited.

CEF02 Recommendation 6.3 – US HEP experiment leaders should advocate with international experiment leadership for pathways to sustainable membership for PUIs, which are most common in the US. Postdocs should be aware of options for entering these pathways so they are not discouraged from applying to PUI faculty positions.

CEF02 Recommendation 6.4 – HEP experiments must continue to improve options for remote participation in experiment meetings and service tasks, especially operational shift work.
11.3.3 Connections with other Frontiers and Topical Groups

Improvement in career pipeline and development requires improvement physics education as discussed in Section 11.5 to prepare a skilled workforce needed for HEP and career migrations industry and improve diversity, under-representation and inclusion in HEP as discussed in Section 11.4. HEP experimental physicists have developed expertise and transitioned into accelerator physics; this is essential to HEP operations and applications in industry, such as medical, materials, pharmaceutical, chemical and biological areas. Small scale experiments in neutrino, dark matter, nuclear and rare processes are sources of training for HEP physicists and transitions to industry. Technology transfers and applications in industry as discussed in Section 11.2, in addition to training in instrumentation and detector technologies, can enhance fruitful career transitions cite CEF02 report here.

11.4 CEF03: Diversity, Equity and Inclusion

This topical group focused on issues and projects related to (1) Diversity, (2) Inclusion, (3) Equity and (4) Accessibility; all are essential not only to professional success in our field, but to developing a better society at large. The group gathered information concerning diversity, equity, inclusion and accessibility in high energy physics, instances of success and failure, and actions that have been taken to promote our tenets. Thirty-two letters of interest were tagged to this group; other inputs came from surveys, town hall meetings and discussions. Ultimately, twelve contributed papers were developed, as detailed in Ref. cite CEF03 report here. The contributed papers may be categorized as follow:

- Accessibility in High Energy Physics: Lessons from the Snowmass [10];
- Lifestyle and personal wellness in particle physics research [11];
- Climate of the Field: Snowmass 2021 [12];
- Why should the United States care about high energy physics in Africa and Latin America [13];
- Experiences of Marginalized Communities in HEP [14, 15, 16, 17, 18];
- In Search of Excellence and Equity in Physics [19];
- Strategies in Education, Outreach, and Inclusion to Enhance the US Workforce in Accelerator Science and Engineering [20].

11.4.1 Accessibility in High Energy Physics: Lessons from the Snowmass Process

Various barriers may impede on full participation in HEP activities; in Ref. [10], using the results of surveys, experiences and additional feedback from community members, and best-practice guidelines, the authors
studied accessibility to engagements in HEP and offered recommendations for improvement. The authors discussed the resources and funding needed to implement the recommendations. Barriers to accessibility include lack of financial support, mental health issues, deaf/hard of hearing, visual disability/blind, caretaker responsibilities and virtual access. These barriers affect the community as a whole by impacting on the ability to collaborate with the members that face accessibility challenges. Survey respondents said that logistics for accessibility should not be the burden of the persons that need access; the availability of transcripts and auto-captioning were noted; however, these fail to transcribe correctly all ramifications of human expressions. Furthermore, resources available often require advance planning and funding and these are the core recommendations for organizing accessible physics events. More details on the studies done and recommendations can be found in Ref. [10].

11.4.2 Lifestyle and personal wellness in particle physics research activities

The demand of particle physics activities may result in an unhealthy imbalance between work and personal life. Unequal remunerations, living conditions and caretaker responsibilities and competitiveness for career progression, visibility, and grants, are among the causes for poor work-life balance. These career requirements lead to working after-hours, during weekends and holidays; teleworking may be impacted by living conditions and may blur the boundaries of work and personal times. Such an imbalance may result in mental health issues, burnouts, poor job satisfaction, and poor performance [11]. Other triggers of work-life imbalance are the expected activities that do not translate into research outputs or are not compensated in career evaluations—these include work for community engagement as noted in Section 11.6, for DEI initiatives, mentorship, refereeing, reviews, hiring committees, etc. Furthermore, as noted Refs. [15, 16, 17, 18], unwelcoming working environment that translates into discrimination, harassment, non-inclusion, code of conduct violations, etc., places undue burden on the victims and members of marginalized communities and lead to work-life imbalance. In Ref. [11], the authors propose recommendations or actions to improve work-life balance.

11.4.3 Climate of the Field: Snowmass 2021

The state of existing policies and their effectiveness to create an inclusive, equitable and safe environment for HEP engagements are discussed in Ref. [12]—“climate of the field”. In many scientific engagements, code of conduct guidelines are in place to define respectful interactions. Mechanisms to address violations are also defined. Yes, implementation of these guidelines and how violations are reported and addressed, are affected by the “climate of the field”. An example is how a violation is handled when it occurs in a collaboration and the concerned parties (perpetrator and victim) have different institutional affiliations. Often, group dynamics and power dynamics lead to an inability to adhere to code of conduct guidelines and address violations; this creates an unwelcoming environment and alienates victims and marginalized folks; as noted in Ref. [11], it also impacts on work-life balance. The contributed paper of Ref. [12] provides recommendations for several top-down approaches that should be implemented by the community as well as recommendations for funding agencies to support these approaches.
11.4.4 Why should the United States care about high energy physics in Africa and Latin America?

Contributions of developing countries to high energy physics activities are hampered by limited resources and national priorities. The Title VI Act, designed to support US national interests and maintain global competitive edge in the international arena, is a compelling reason for the United States to support HEP in developing countries. Mechanisms and recommendations to improve HEP engagements with Africa and Latin are articulated in Ref. [13] where it is argued that such sustained engagements will help international development, improve diversity and increase the participation of developing countries in HEP.

11.4.5 Experiences of Marginalized Communities in HEP

Power dynamics, informal socialization, policing and gate keeping in HEP create an environment and culture that alienate under-represented physicists and negatively affect their participation. Often, privileged folks lack awareness and attention or focus on perception rather than reality; therefore, they hang on to claims of objectivity in physics which only serve to maintain the culture of under-representation and non-inclusion, to deny the negative experiences of marginalized physicists, and to expect them to shrug off these bad experiences, despite the harm caused, in order to be taken seriously as physicists. The key to improve the experiences of BIPOC physicists consists of addressing the complexity and impact of power dynamics, policing and gate keeping [16, 17], and implementing actions individuals and organizations can take to lower barriers for early career BIPOC physicists [18].

Despite all the efforts and investment to improve DEI in HEP, these issues remain as demonstrated in Refs. [15, 16, 17, 18, 14]. We offer concrete suggestions towards improving DEI; these suggestions include effective approaches to reach members of marginalized communities through engagements as discussed further in Section 11.6 and Ref. [14].

11.4.6 In Search of Excellence and Equity in Physics

The claims of objectivity in physics lead to meritocracy, i.e. the idea that “scientific work is judged on its merits and that opportunities in physics are equitably available to all aspirants”. However, as demonstrated in Ref. [19], there is far more under-representation than could be expected from meritocracy. This further challenges the claims of objectivity in physics, along similar lines as Refs. [15, 16, 17, 18, 14]. To address this, changes in community practices are needed; we should challenge or verify organizational claims of equitable access. Focused efforts, continuous measurements and frequent corrections are required to achieve fair procedures, eliminate barriers and improve under-representation [19]. The physics community should seek best practices on how to combine equity and excellence; the private sector has made some progress to match best practices to company values, thus mitigating damages resulting from public exposure of misconduct. The need to enforce codes of conduct and to address violations, mentioned in Ref. [12], are also echoed in Ref. [19]. The American Physical Society has made efforts towards an equitable, diverse and inclusive field; however, community participation is required to improve excellence and equity. Meritocracy, instead of cronyism, is important to identify leaders. In Ref. [19], the authors go further to suggest recommendations towards an ethical hiring process for excellent leaders that will uphold the values of equity.
11.4.7 Strategies in Education, Outreach, and Inclusion to Enhance the US Workforce in Accelerator Science and Engineering

Accelerators, large or small, play important roles in fundamental research and applications; they are essential to discovery science and high technology, thus can help to train a strong technical workforce needed for particle physics research. In Ref. [20], the educational and outreach opportunities available in accelerator science and engineering are reviewed, with the objectives to attract talents and develop capacity for future R&D; in this process, the need to improve diversity, equity and inclusion is noted—the participation of women in the US Particle Accelerator School (USPAS) has increased; however, under-representation of women and historically marginalized groups still persists. Recommendations are proposed to improve diversity, equity and inclusion in accelerator science and engineering [20].

11.4.8 Recommendations to Improve Diversity, Equity and Inclusion in HEP

From the aforementioned work in Section 11.4, we have prepared recommendations and resources that are tailored to particle physics, cosmology, and astrophysics, to promote diversity and encourage equity, inclusion and accessibility at all levels of scientific discourse, engagements and managements.

11.4.8.1 Recommendations for Funding Agencies

CEF03 Recommendation F1 – HEP communities must employ the use of robust strategic planning procedures, including a full re-envisioning of science workplace norms and culture.
CEF03 Recommendation F1.1 – Prioritize community-related issues at the funding level.

This might include the inclusion of community-related topics into safety parts of collaboration “Operational Readiness Reviews,” “Conceptual Design Reviews,” or similar documentation submitted to funding agencies. Funding agencies should provide clear and enforceable requirements for the advancement of DEI issues in grants, programs, and evaluations [12].

CEF03 Recommendation F1.2 – Funding agencies should provide formal recommendations for institutions and collaborations for handling violations of their codes of conduct.

This should include advice on handling community threats, removal of collaboration affiliates, leadership rights and responsibilities, and protections against legal liability for leadership that is responsible for that enforcement. This should also include advice on reporting to the funding agency itself; if there is no mechanism for reporting misconduct to a funding agency, that mechanism should be developed [12].

CEF03 Recommendation F1.3 – Funding and structural aid should be made available to develop “Collaboration services” offices at host laboratories.

Such offices should provide HEP collaborations and other physics communities of practice with the following: a) advice on legal and policy topics including those listed in F1.2, b) training in project management and ombudsperson training, c) logistical tools including facilitation of victim-centered investigation and mediation, d) resources and funding for local meeting accommodations, and other topics as described here in Section 11.4.8 [12, 10, 18, 16, 19].

CEF03 Recommendation F1.4 – Funding agencies should use their leverage to promote community-focused policies at funded institutions.

Funding agencies should require institutions that receive funding to implement policies on vacation time, parental & family leave (for all genders), and health leave for all levels. Funding agencies should require institutions to prohibit confidentiality in settlements for egregious behavior (e.g. harassment); this promotes accountability and prevents known perpetrators from continuing to harm their communities [11, 12].

CEF03 Recommendation F1.5 – Funding agencies should establish a dedicated Office of Diversity, Equity, and Inclusion to work with Program Officers.

Funding agencies should establish the DEI Office to work with program officers to strategize and prioritize funding decisions and to develop equitable practices for the review processes [14].

CEF03 Recommendation F2.0 – HEP communities must implement new modes of community organizing and decision-making that promote agency and leadership from all stakeholders within the scientific community.
CEF03 Recommendation F2.1 – Funding agencies should facilitate Climate Community Studies.

Studies should not be the responsibilities of individual communities. These studies should be informed by expertise in social and organizational dynamics [12].

CEF03 Recommendation F2.2 – Grant calls and assessments should include clear definitions of the tasks expected of PIs, including DEI related tasks, and provide grant funding for each.

Alternatively, agencies could provide specific grants and awards for EDI and mentorship work. Agencies should ensure that they pay those on their grant review panels for their time [11].

CEF03 Recommendation F2.3 – Funding agencies should collect, analyze, and publish demographic information on grant proposals and funded grants.

PI and funded and unfunded researcher demographic information on grant proposals should be collected and used to track the effectiveness of these measures and are necessary to inform any additional policy changes needed to advance DEI policies and structures [11, 18].

CEF03 Recommendation F2.4 – Pay for fellowship- / grant-funded student and postdoctoral researcher positions must increase.

Pay should include cost-of-living adjustments, health / wellness / leave benefits, and relocation expenses [11].

CEF03 Recommendation F2.5 – The US HEP community maintains the current engagements and increases investments in Africa and Latin America to improve the reach of HEP in these regions.

Funding agencies and international collaborations should acknowledge the disparity in economic capabilities of countries in Africa and Latin America compared to what is available in the United States. Funding agencies should support the development of HEP in these countries, should support and lead initiatives for more equitable contributions (e.g. membership and operations fees for participation in large collaboration, conference fee waivers and travel support to US-based meetings, etc) [13].

CEF03 Recommendation F3 – HEP communities must engage in partnership with scholars, professionals, and other experts in several disciplines, including but not limited to anti-racism, critical race theory, and social science.
CEF03 Recommendation F3.1 – Funding should be made available to both engage with and compensate experts in DEI, anti-racism, critical race theory, and social science.

This can take the form of independent grants, but more effective would be the inclusion of climate-related topics into safety components of collaboration “Operational Readiness Reviews,” “Conceptual Design Reviews,” or similar documentation submitted to funding agencies [12].

CEF03 Recommendation F3.2 – Community studies should be run by and receive advice from experts in sociology and organizational psychology.

The tools used to evaluate the climate of HEP need to be adequate, effective, and informative. These studies and accompanying expertise should be funded at the federal and institutional levels. They should include evaluation of leadership selection, development of junior scientists and their trajectories, and the existence of detrimental power dynamics that specifically affect underrepresented groups. Undesirable systems should be addressed with direct intervention [12, 16, 18].

CEF03 Recommendation F3.3 – Grant calls and assessments should include the advice of professionals in DEI and education.

Such experts should review the entire process, including portfolios in their entirety, but with specific attention to mentorship and EDI plans. Experts should be paid for their time [11].

11.4.8.2 Recommendations for HEP Communities

CEF03 Recommendation C1 – HEP communities must employ the use of robust strategic planning procedures, including a full re-envisioning of science workplace norms and culture.
CEF03 Recommendation C1.1 – HEP communities should support and take advantage of existing support structures and informational networks.

Tools exist to support efforts to improve diversity and inclusion, as well as to address injustices in our communities. These include the American Association for the Advancement of Science (AAAS) Diversity and the Law program [21] which hosts resources to enable promotion of legal and policy goals related to DEI. Knowledge like that collected by the American Institute of Physics’ National Task Force to Elevate African American Representation in Undergraduate Physics & Astronomy (TEAM-UP) Project [22, 23] and the AAAS’s STEMM Equity Achievement (SEA) Change [24] should also be promoted [16].

CEF03 Recommendation C1.2 – Institutions and HEP communities must develop reporting mechanisms and sanctions for egregious behavior.

These institutions and communities should transparently describe those mechanisms in full for the benefit of all affiliates. Communities must be prepared to exercise those mechanisms. Future HEP community codes of conduct should align with, and current codes of conduct should be reviewed upon new recommendations from funding agencies regarding enforcement and disciplinary measures [12].

CEF03 Recommendation C1.3 – The community should prioritize the implementation of best practices networks across institutions and communities of physics practice.

This may be facilitated through Collaboration Services Offices (F1.3), but may also include the facilitation of networks between DEI groups at similar collaborations [12].

CEF03 Recommendation C1.4 – All community affiliates should reject harmful rhetoric and behavior related to work-life balance.

This includes “ideas around ‘lone geniuses’, the need for unhealthy work schedules, and the idea that sacrifice of personal wellness demonstrates your commitment to science” [11]. Senior scientists are responsible to ensure that they are managing their time and the time of those in their group properly to respect work-life balance (including meetings outside of working hours, or rotating meetings to accommodate varying time zones) [11].
CEF03 Recommendation C1.5 – Departments and institutions should have clear definitions of job responsibilities and ensure that they are funding all functions of the job.

This includes any DEI work. Assessments should weight work in these areas equally and individuals should be awarded and/or recognized when they excel. Evaluation for employment should be based on carefully developed, public rubrics that include DEI, outreach, and service. Such rubrics should be created with considerable care and research-driven (e.g. if any of the criteria are biased in a way that would limit access or promotion of people who identify with an underrepresented group) [11, 12, 18].

CEF03 Recommendation C1.6 – Departments and institutions should reject the use of standardized exams in favor of holistic rubrics for admission.

Evaluation for admission should reject the use of standardized exams and instead should be based on carefully developed, public rubrics, that are tailored to the department. Such rubrics should be created with considerable care and be research-driven (e.g. if any of the criteria are biased in a way that would limit access or promotion of people who identify with an underrepresented group) [11, 12, 18].

CEF03 Recommendation C1.7 – Graduate students and postdoctoral researchers should be paid at the level of their respective skill levels

This includes benefits like relocation services, health coverage (including families), retirement savings, subsidized family housing, and are not taxed for fellowship money they do not receive as pay. These benefits must apply while students and their families are abroad on behalf of HEP activities [11].

CEF03 Recommendation C1.8 – Institutions should have accessible, clear, robust, and flexible policies for parental / family leave (for all genders) and vacation time.

These should be guaranteed at all levels. Junior scientists should be made aware of and encouraged to take advantage of institutional policies and resources on diversity, health, leave, vacation, and wellness [11].

CEF03 Recommendation C2 – HEP communities must implement new modes of community organizing and decision-making that promote agency and leadership from all stakeholders within the scientific community.
CEF03 Recommendation C2.1 – Reviews of community climate should include an evaluation of how leadership is selected within HEP collaborations, as well as the valuation of sub-community contributions.

This should include an expert-advised review of the assignment of high-impact analyses & theses topics, convenership of working groups, and public-facing roles representing the collaboration such as spokespersons or analysis announcement seminars. Power dynamics within communities should also be evaluated, and should consider the impact that senior scientists can have especially on junior scientists of color. It should also include reviews of the participation of “non-scientists” in community engagement and authorship, community perceptions of operations and service work, the development of onboarding and early-career networks, and implementation of policies toward equity in information sharing and software [12, 16, 18, 19].

CEF03 Recommendation C2.2 – Collaborations should train members in standards in the field and offer mentorship programs to ensure that postdocs and students (especially from underrepresented groups) have additional support and resources.

Mentorship programs should be research-driven and should make access to information as ubiquitous as possible. Mentors should help novices navigate the complicated landscape of the community, and care should be taken to address the “untold rules”, like non-academic career trajectories. Information sharing, especially about collaboration policies, procedures, and code-bases, should be evaluated from an equity lens [11, 18, 12].

CEF03 Recommendation C2.3 – Conferences should offer financial assistance to individuals with hardships.

Conferences should offer limited travel grants through an application procedure overseen by an ethics group associated with the conference. To promote the engagement of under-resourced and early-career scientists, conferences should also strongly consider developing an application for sliding-scale / waiver for conference registration fees. Conferences should accommodate caregiving responsibilities by providing childcare onsite, or by supporting the travel of an accompanying person. In both situations, extra funding should be budgeted by the conference to fully or partially cover those costs [10].
CEF03 Recommendation C2.4 – The organizers of all HEP activities should ensure that people with accessibility barriers are truly accommodated, with guaranteed, low-friction, dignified access to all aspects of the experience.

All conferences, collaborations, universities, and labs should be made accessible to people with disabilities. For example, conferences (including virtual meetings) should be announced with enough time to arrange accommodations for any individual needs, and organizers should plan to secure funding and book services far enough ahead of time. Accommodations should include both steno-captioning and ASL interpretation, which should be fully funded as part of the conference budget. Conferences should also be accessible to the blind / low-vision community, which may include screen-reader-accessible tools and “color-blind-friendly” plots. Other accommodations include: seating or accessible access to amenities like check-in and meals; locating the conference in ADA-compliant buildings with no obstructions to seating, entrances / exits, or accessible pathways; quiet spaces; and designated contacts for troubleshooting accessibility. An extensive list of recommendations can be found in [10].

CEF03 Recommendation C2.5 – US universities and research labs should encourage and support the participation of their personnel, faculties and research staffs in HEP education and research efforts of African and Latin American countries.

US institutes need to partner with Latin America and Africa in establishing bridge programs and supporting community members from Africa and Latin American to come to United States laboratories and universities for research experience programs. Collaborations and conferences should seriously consider decreasing or waiving membership and operations fees for participation and should provide financial assistance for travel to the United States [13].

CEF03 Recommendation C3 – HEP communities must engage in partnership with scholars, professionals, and other experts in several disciplines, including but not limited to anti-racism, critical race theory, and social science.

CEF03 Recommendation C3.1 – Experts should be adequately integrated into HEP communities.

This is motivated by the need to apply their expertise effectively, and should include collaboration communities. This may take the form of an official collaboration role like a non-voting member of a collaboration council [12].

CEF03 Recommendation C3.2 – Identification of leaders within HEP communities should be research-driven.

HEP organizations and institutions require leaders who will promote policies and practices that support underrepresented and historically marginalized groups instead of favoring “politics and convenience”. Best practices have been developed by industrial & organizational psychologists and are under studies at NSF (e.g.[25]). Details on necessary search practices can be found in [19].
11.4.8.3 Recommendations for Future Snowmass Activities

CEF03 Recommendation 4.1 – Think strategically about how Community Engagement topics are integrated into other frontiers.

This work is the work of all HEP community members, and should not be relegated entirely to an independent, volunteer-driven frontier.

CEF03 Recommendation 4.2 – Funding for Snowmass activities should include critical infrastructure for accessibility.

This includes live captioning for all public events, and infrastructure for hybrid meetings to support those who cannot travel to attend workshops.

11.5 CEF04: Physics Education

CEF04, the Physics Education (PE) topical group, examined the role that physics education at all levels plays in advancing the field of HEP. Two goals were identified as critical for the long-term health of the field: 1) attracting students across all demographics to the study of physics, and 2) provide them the education, training, and skills they will need to pursue any career in STEM or related fields. The CEF04 Topical Group Report puts forth recommendations intended to achieve these goals by strengthening ties between researchers and teachers, the academy and the private sector, and domestic and international students [25].

The PE group framed its studies according to the pyramidal scheme displayed in Figure 11-2. This diagram rises from the relatively large number of K-12 science students at the base up to the small apex of faculty-level physicists. The work was organized into four groups, each of which produced a contributed paper presenting detailed examinations of physics education challenges and opportunities at each level. The working group contributed papers are:

- Opportunities for Particle Physics Engagement in K-12 Schools and Undergraduate Education [26];
- Transforming US Particle Physics Education: A Snowmass 2021 Study [27];
- Broadening the Scope of Education, Career and Open Science in HEP [28];
- The Necessity of International Particle Physics Opportunities for American Education [29];

11.5.1 Particle Physics Engagement Opportunities in K-12 and Undergraduate Education

The first working group found that partnerships between academia and K-12 teachers and students are effective in nurturing early student interest in math and science. It is important to provide a broad exposure to the different STEM fields at all levels in order to develop properly their scientific literacy. The key recommendations for forming these partnerships are:
CEF04 Recommendation 1 – At the local level, form collaborative communities (“fora”) of academics of all backgrounds (physicists, engineers, technicians and K-12 teachers).

CEF04 Recommendation 1.1 – These fora should be supported by a nationally, or even internationally, organized online repository for sharing resources.

CEF04 Recommendation 1.2 – The fora can only be created and sustained if a minimal amount of support for coordination and logistics is made available. For sustainability, it is important to have a steady source for this support, which can come from colleges, universities or institutes, but might also come from or be supplemented by outreach support in research grants. Another important ingredient for sustainable fora is that the efforts of the participants are appropriately and regularly recognised.
11.5.2 Educational Opportunities at the Graduate and Postdoctoral Levels

Education and training specific to particle physics generally occurs during the graduate student and post-doctoral researcher stages, and usually takes place at universities and laboratories. An online survey of the US HEP community was conducted to gain insight on students’ experiences during this phase. On one hand, respondents indicated that this is the point at which students are expected to gain the skills necessary to launch a career in HEP. However, they also expressed that the training they received through formal education did not match the skills needed to succeed in physics. To address this disconnect in advanced education, the following recommendations are offered:

CEF04 Recommendation 2 – Graduate programs in particle physics should normalize training for a broad range of STEM careers with appropriate formal courses, rather than forcing students to resort prematurely to self-teaching or peer learning. The courses should provide strong grounding in particle physics and mathematics, but also computation, statistics and instrumentation, with the aim to benefit careers in physics, industry or education.

CEF04 Recommendation 3 – Correspondingly, universities should provide undergraduate students with a more complete picture of what particle physics trained researchers do. A realistic view of common career paths post baccalaureate and postgraduate school should be presented, including for theoretical and experimental positions as well as non-academic careers.

CEF04 Recommendation 4 – Undergraduate participation in the survey was rather minimal, driven in part by lack of information. With support from Professional Societies and Physics Departments, connections and networking Community Planning Exercise: Snowmass 2021 opportunities should be developed to strengthen connections for undergraduate students with HEP community activities. The HEP Community should actively plan to perform a future survey with emphasis on undergraduate participation, to assess and strengthen links to students at that academic level.

CEF04 Recommendation 5 – Universities, especially non-research universities, should consider setting up Masters Degree programs in particle physics and related areas, such as hardware and software technology for Big Science experiments.
11.5.3 Collaborative Opportunities Across Academia

An important challenge for HEP is the need to broaden and diversify the pool of talent and expertise drawn to the field. A crucial part of the solution to this problem is to build more collaborations between groups at the R1 research institutions that traditionally represent the vast majority of the HEP community, with R2 institutions, Predominantly Undergraduate Institutions (PUI), and Community Colleges (CC).

CEF04 Recommendation 6 – Expand the benefits of faculty collaboration and research opportunities across the broad spectrum of academia and give equivalent opportunities for all in technical and scientific leadership on projects, with appropriate recognition for contributions.

CEF04 Recommendation 6.1 – Conduct a study of new models of collaboration or cooperation that would allow R2/PUI/CC faculty and their students to collaborate in demonstrably effective ways in experiments. This includes addressing the challenges of teaching loads, student training and funding availability that directly impact consequential participation.

CEF04 Recommendation 6.2 – Make data and analysis platforms broadly accessible to benefit student access and participation. In the true spirit of Open Science, the HEP community should define, with cogent arguments, the scope of making our data and resources publicly available, and the hardware, software and person-power costs associated with such implementation.

Fields such as instrumentation, computation, and machine learning have become critical components of the HEP enterprise. However, career paths at the intersection of particle physics and these specialized fields are not very clear or easy to navigate, nor universally recognized as “physics” work. Improving this situation would simultaneously address pipeline and retention issues within HEP, and equipping colleagues for careers outside the field.

CEF04 Recommendation 7 – Qualification for HEP faculty jobs should not be based solely on physics analysis but must be expanded to include computing, software and/or hardware contributions.
11.5.4 International Opportunities for Particle Physics Education

High Energy Physics is conducted through global international collaborations. These diverse partnerships enrich the intellectual environment of our field. As such, training in international collaboration throughout the educational process will facilitate more productive integration of talent and resources in future projects.

CEF04 Recommendation 8 – US-based pre-university particle physics collaborations, such as QuarkNet and other outreach programs, should expand collaboration with international partners, such as the International Particle Physics Outreach Group (IPPOG), the CERN Beamline for Schools (BL4S) and Teacher summer school programs in Europe, and should collaborate with partners in the developing world, such as the African School of Fundamental Physics and Applications. Participation in the Global Cosmics portal should be enhanced by developing low-cost cosmic ray detectors for educational use.

CEF04 Recommendation 9 – Student exchange programs should be fostered and supported, such as the NSF Research Experience for Undergraduates (REU) program, which funds participation of US students in the CERN Summer Student program, and the DOE-INFN summer student exchange program between the United States and Italy. Where possible these should be extended, in particular with student exchange programs and summer schools in developing countries, such as the African School of Fundamental Physics and Applications.

11.6 CEF05: Public Education and Outreach

This working group deals with necessity to develop (or improve) effective means to communicate the research, its results, applications and impacts to the general public, students and policymakers. Through engagement programs, the community of physicists should to generate enthusiasm and interests in physics, particularly among pupils.

Thirteen LOI were tagged to the Public Education and Outreach topical group. Some of the LOI were consolidated and developed into contributed papers in Section 11.4 about diversity, equity and inclusion [14, 20] and Section 11.5 about physics education [26, 28, 29]. Other LOI were condensed into two contributed paper topics, namely:

1. The need for structural changes to create impactful public engagement in US particle physics” [30];
2. “Particle Physics Outreach at Non-traditional Venues” [31].

In addition the LOI, the group collected inputs through regular meetings, organized discussions and surveys. During the organized discussions, the group invited experts, with the objective to collect inputs on how to improve public engagement. The group also conducted a survey of the physics community and received 358 responses. The majority of the respondents has participated in outreach activities. Respondents mentioned...
lack of time and career benefits as major factors that prevent or limit physics engagement. Respondents do public engagement to reach underserved groups, show openness or scientific method to the public, share their their enthusiasm or inspire the next generation of physicists. They use storytelling or share their own motivation for for pursuing physics. To get involved in public engagement, respondents suggested to start small and up experience in speaking to the public, and find and plug into established engagement programs. Details on the group activities are compiled in the topical group report cite CEF05 report here.

We recall here the recommendations to improve public engagement; structural changes are required as all levels, i.e. research groups, experimental collaborations, conferences, universities and colleges, national laboratories, OSTP, Congress, DOE, NSF, private foundations, AAAS, APS, and DPF [30].

CEF05 Recommendation 1a – Enact structural changes to better enable public engagement

In general, we recommend:

- Providing or financially supporting training in effective public engagement
- Supporting the creation of public engagement programs that scientists can participate in
- Codifying the importance of public engagement in official documents such as:
  - Laboratory contracts
  - Faculty handbooks
  - Professional society strategic plans
  - Experimental collaboration constitutions
  - Merit criteria used by institutions that fund research

CEF05 Recommendation 1b – Enact structural changes to better enable public engagement

Also, we recommend:

- Considering public engagement along with activities such as service and teaching in:
  - Hiring
  - Tenure
  - Promotion
  - Other reviews
- Funding public engagement work as part of grant proposals

CEF05 Recommendation 1c – Enact structural changes to better enable public engagement

We further recommend:

- Incorporating public engagement into conferences and meetings in the form of
  - Plenary talks
  - Parallel sessions
– Public lectures

– Training opportunities for conference participants

– Public engagement opportunities for conference participants

• Recognizing and rewarding scientists who contribute to public engagement efforts

We also recommend that individual scientists encourage others, including peers, mentees and students, by participating in public engagement and discussing its importance.

A change of focus, from public outreach to public engagement, is also required for more effective two-way interactions to ensure mutual learning between physicists and the public. Mutual learning goes beyond acquisition or transmission of knowledge, to include understanding of perspectives, worldviews and socioeconomic backgrounds. Some innovative ideas on public engagement are discussed in Ref. [31], and details are provided in the topical group report cite CEF05 report here. We recommend a change to more effective public engagement:

CEF05 Recommendation 2 – Update topical group name

To reflect this shift in priorities, and also to clear up confusion between the goals of our topical group and the topical group focused on physics education, we propose changing the name “Public Education and Outreach” in the next Snowmass process to simply “Public Engagement.”

Public engagement can help recruit and retain scientists from diverse backgrounds, thus improving diversity as discussed in Section 11.4. Therefore, learning how to reach members of marginalized communities via public engagement is essential. Public engagement with lack of preparation and understanding and without working in equal partnership with the targeted communities, can be counter-productive and harmful [32]. The targeted community members should included in the planning of public engagement efforts. Working towards addressing the needs of the intended community must be the objective, achievable through building relations and inclusion [14]. A detailed checklist of questions to address when preparing to engage marginalized communities is mentioned in Section 11.4 and recalled here.
CEF05 Recommendation 3a – Consider the audience, Identify and remove barriers

Consider the audience:

• Who specifically are we hoping to reach with this event? Why are we hoping to reach these communities?

• How can we plan this event to make it maximally beneficial to these communities? What elements of this plan can we continue to use in other events?

• What are the best ways to communicate about this event with members of these communities? Can we continue going to those same channels to communicate about other events?

• Have we created a process by which we take time to evaluate the success of the event after it concludes?

• What metrics (both qualitative and quantitative) will we use? Which of these metrics will we continue to use in evaluating other events?

Identify and remove barriers:

• Are there logistical barriers (e.g. time of day, day of the week, public transportation access, affordability, safety concerns, financial barriers) to our events that make them inaccessible to these communities? What will we do to address these barriers?

• Have we allowed adequate lead time and budget to make this event accessible to all members of these communities, including those with disabilities? Have we identified partnership or staffing needs required to make the event accessible?
CEF05 Recommendation 3b – Value partnerships, Build lasting relationships

Value partnerships:

- What members of these communities will make good partners in this event? Have we made sure they’re involved in planning the event? Have we secured an adequate budget to support fair compensation for our partners as co-creators of the event, prior to requesting their labor?

- Do any members of these communities work for our institution? If they do, do they work in roles with decision-making power (e.g. managerial positions), or do they work primarily in service roles? If members of these communities do not work at our institution, or work only in lower-level positions, is our institution making any effort to change this?

- Are members of these communities who work for our institution participating in this event? If so, are they receiving the support they need to take on this effort and fulfill their other job duties? Do they have decision-making power over the planning and execution of the event? Are they being fairly compensated and recognized for their efforts?

Build lasting relationships:

- Is this event a part of a larger effort to build relationships with members of these communities? If so, what is the long-term plan? Who will be responsible for enacting it?

- Are there ways in which our institution is causing harm to members of these communities? If so, how is our organization working to change this?

- How are representatives of our institution involved in these communities outside of this event? Are there ways our institution can work with members of these communities on their priorities, even ones that do not directly benefit our institution?

We recommend finding ways to implement the recommendations for structural changes needed for improved public engagement. We further recommend that the physics community builds lasting relationships with marginalized communities through public engagement; this will contribute to improve diversity in HEP as discussed in Section 11.4. Finally, we recommend that the American Physical Society’s Division of Particles and Fields monitors progress on these goals towards the next Snowmass process.

11.7 CEF06: Public Policy and Government Engagement

The topical group CEF06: Public Policy and Government Engagement (PPGE) was tasked with conducting a review of all current interactions between the HEP community and government offices and individuals. This enterprise includes identification of consensus positions on policies with direct impact on our field, development of unified messages from HEP to those determining and implementing policy, and creation and deployment of tools and resources effectively to communicate those messages in a manner resulting in positive policy outcomes. Those working in PPGE identified areas of HEP government engagement that are missing or in need of improvement, and developed recommendations to address these opportunities. Three contributed papers produced by PPGE document this work:
• Congressional Advocacy for HEP Funding [33];
• Congressional Advocacy for Areas Beyond HEP Funding [34];
• Non-congressional Government Engagement [35];

and details of the analysis, synthesis, and recommendations based on those papers is presented in the CEF06 Topical Group Report [].

11.7.1 HEP Funding and Advocacy Organization

Over the past few decades, HEP communication with government has largely focused on advocacy for strong federal budget support for HEP, which comes almost exclusively through the Department of Energy (DOE) Office of Science (OS) and the National Science Foundation (NSF). Funding of federal government programs is an extremely complex cyclical process; however there are three basic steps that provide target points for our advocacy. The first is the creation of the annual President’s budget request (PBR), which is formulated by the Office of Management and Budget (OMB), with advice from the Office of Science and Technology Policy (OSTP), which works closely with DOE and NSF. The second step is for Congress to pass a budget, which sets topline numbers for funding each major area of government spending. Although the Budget Committees create the budget, it is informed and guided by individual authorization bills, which specify what Congress may spend money on, and these bills come out of authorization committees. Getting specific language supporting HEP programs into authorization bills greatly increases the likelihood of positive funding outcomes. The third major step is appropriations. Appropriations committees make the decisions on the actual yearly allocation of funds to all government agencies and programs within the constraints of the Congressional budget topline numbers.

The DOE OS and NSF receive HEP program planning advice from a federal advisory committee, the High Energy Physics Advisory Panel (HEPAP). HEPAP has a subpanel known as the Particle Physics Project Prioritization Panel (P5), which produces reports detailing long-range strategic plans for US HEP that are largely based on studies resulting from the Snowmass community planning process. The most recent P5 report from 2014 has served as the core of our field’s message and advocacy to government for nearly a decade. The effectiveness of our messaging and advocacy over this time is indicated by the fact that DOE funding of HEP has grown by 36%, or roughly $300M since 2015. This advocacy is carried out jointly by the Fermilab Users Executive Committee (UEC), US-LHC Users Association (USLUA), and SLAC Users Organization (SLUO) with help from the American Physical Society Division of Particles and Fields (APS DPF). However, this group does not have the mandate nor resources to address any aspects of engagement with the government beyond federal funding advocacy (and not enough even to sustain fully that activity). Some new structure must be put in place to broaden HEP’s engagement with government to effectively work for policies to strengthen our field.

11.7.2 Message Unity Around P5

Advocacy for the 2014 P5 plan has been very successful, leading to a current DOE budget for HEP in excess of $1B. Critical elements of that success are that P5 represented a single comprehensive plan for the entire US HEP program that had community-wide buy-in, and this led to one unified message that our field delivered to Congress and the Executive Branch. Prior to 2014 P5, our messaging was fragmented, with people inside...
and outside the HEP community bringing their own takes on the HEP program to policymakers that were inconsistent with our community-organized advocacy. HEPAP and the 2022 P5 have to lead the effort to build a consensus message around the new P5 plan. This has to include both educating the community and the government about the new plan, and providing ample opportunity for community feedback, both for the initial rollout of the P5 plan, and for updates and changes to the plan that will inevitably occur.

CEF06 Recommendation 1 – HEPAP must develop community unity around the P5 plan and a clear message on the field priorities, by a) A wide-reaching outreach program, including both community inreach, congressional and executive branch education and messaging; b) Providing mechanisms for community feedback.

11.7.3 Congressional Advocacy for HEP funding

The community’s advocacy for federal funding support of HEP largely consists of the annual trip to Washington, DC, during which a group of our colleagues meet with as many Congressional offices as possible, as well as with OMB, OSTP, DOE, and NSF. The ‘DC Trip’ is organized by UEC, USLUA, and SLUO each spring to fall between the release of the PBR and the markup of appropriations bills. These user organizations are composed of elected representatives of our community, and the roster of trip attendees is intentionally selected to broadly represent the entire field. This effort has grown dramatically over the past two decades. Around 2004, roughly 25 attendees visited about 150 offices. With increased funding support, by 2019 almost 70 attendees visited all 541 Congress members’ offices as well as 8 subcommittee staff and the Executive Branch offices.

CEF06 Recommendation 2 – The FNAL, SLAC, USLHC Users groups and APS DPF must support and grow the annual HEP Congressional advocacy effort.

The DC Trip requires a huge organizational effort that has been made possible by the development of a number of tools and resources. Foremost among these is the Washington-HEP Integrated Planning System (WHIPS), which is a framework to automate most of the planning, execution, and documentation logistics. There is also a twiki repository of trip information and an HEP funding and grant database. These resources have been developed and maintained by volunteer effort, and a more permanent plan for further development and sustainability of these and new tools must be implemented to ensure their continued availability. There are many professionally-produced communication materials created for the DC Trip. These documents convey our advocacy messages to government offices, and many also serve to share different aspects and benefits of HEP to other audiences. They have been developed by the user organizations in concert with the Fermilab Office of Communication, DOE, and the P5 chair, but there is no guarantee that those groups and individuals will be able to continue providing that support. Training materials have also been created to prepare community members for their participation on the DC Trip. These materials must be regularly updated and deployed. In addition, making them available to the wider HEP community will enable
expansion our advocacy and help ensure unified messaging. Further inreach efforts to inform the field about our advocacy through more frequent talks and annual reports would also help achieve these goals.

CEF06 Recommendation 2.1 – The users groups and APS DPF must ensure that resources in terms of people-power and funding is available to continue to support and development of the HEP Advocacy technical and logistical tools, including WHIPS, the twiki, and funding database.

CEF06 Recommendation 3 – The users groups and APS DPF must continue support for the HEP Communication materials working with the past P5 chair and other pertinent representatives.

CEF06 Recommendation 2.2 – The users groups and APS DPF must ensure that resources in terms of people-power and funding is available for continued advocacy training. In addition, relevant parts of the training currently used for the annual HEP congressional visit should be made more widely available to the community to increase the community’s policy literacy overall, independently of the goals of any year’s particular advocacy efforts.

CEF06 Recommendation 2.3 – HEP congressional inreach efforts should be enhanced, including invited and submitted talks at conferences, collaboration and other community meetings. All efforts should be made to increasing knowledge and awareness of the trip, with avenues made available for community members to participate in organization actives or with the advocacy. An annual report summarizing the trip should be produced and made available to the community.

Several actions could make the program of HEP advocacy stronger. Some specific aspects of the DC Trip require specialized knowledge and experience that currently is held by a small number of long-term participants. These include organizing meetings and building relationships with OMB, OSTP, and Congressional subcommittee staff, and the development and use of WHIPS and other tools. This knowledge base needs to be expanded to more participants. Although efforts are made to achieve broad representation of the community on the trip roster, more needs to be done to ensure representative participation from segments of our field such as Theory and Computation, from colleagues at all career stages, and from underrepresented groups. Finally, opportunities for year-round advocacy should be pursued to engage specific offices (including Congressional local district offices) at other key points in the budget cycle. These opportunities must be weighed against additional resource costs that would be required.
CEF06 Recommendation 2.4 – Documentation should be produced or improved to guide future advocacy effort leaders in the planning of annual activities and made a commonly accessible resources. The roster of those holding special expertise should be expanded from individuals to groups if possible. Detailed documentation should be produced to describe the technical aspects of the tools used to plan advocacy efforts (i.e. WHIPS).

CEF06 Recommendation 2.5 – The demographics of the attendees on the DC trip should be tracked and all efforts should be made for that demographics to be representative.

CEF06 Recommendation 2.2 – The DC Trip group should investigate year-round advocacy as an extension of the annual Congressional advocacy efforts.

11.7.4 Non-Congressional Advocacy

As was mentioned previously, the DC Trip includes meetings with staff from OSTP and OMB. These are the people who provide policy and budgetary guidance concerning science funding to the formulation of the PBR. These meetings are opportunities for HEP to convey the priorities of our field to the Administration, and also for us to learn about the Administration’s science priorities. The materials for and timing of the DC Trip are chosen primarily for Congressional advocacy. These choices are not necessarily optimal for Executive branch advocacy. For example, our meetings with OSTP and OMB take place immediately after the completed PBR is released. The potential impact of these meetings is very high, and could be maximized with materials, messages, and timing specifically targeted for these offices.

CEF06 Recommendation 6 – The FNAL, SLAC, USLHC Users groups and APS DPF should to work to improve community engagement with the executive branch especially with OMB/OSTP.

No HEP-wide advocacy efforts exist that are directed to state or local governments. However, there are state and local engagement efforts carried out between individual facilities and the communities in which they are located. These include the Fermilab Community Advisory Board which provides community input and feedback to Fermilab regarding its programs and projects, and similar situations exist with Berkeley Lab and SURF. In all cases, these engagements have been mutually beneficial to the facilities and their communities.
CEF06 Recommendation 7 – The laboratory users groups, facility and university HEP groups should work to improve engagement with local and state government.

11.7.5 Advocacy for Issues Beyond HEP Funding

All of the current HEP community-wide advocacy is directed toward the support and growth of federal funding for HEP. There are many other policy issues not directly tied to HEP funding that nevertheless impact our colleagues and programs of research. Most are or can be addressed with federal legislation. Among them are DEI, immigration, and research security. While some of these issues are referenced in our DC Trip materials, our advocacy infrastructure does not have the resources, procedures, or mandate to advocate for specific non-funding policy positions. However, there are external groups with larger resources, constituencies and infrastructure that we have access to for broader advocacy. Among these are the APS, American Institute of Physics (AIP), and American Association for the Advancement of Science (AAAS). All of these groups employ government relations staff, and possess the resources and experience to mobilize advocacy for non-funding issues. They also run very active Congressional Fellowship programs which offer opportunities for HEP community members to participate in much more direct and deeper government engagement on policy. These opportunities should be much more widely promoted to the HEP community.

CEF06 Recommendation 4 – A PPGE HEP group should be formed to take ownership of strengthening connections to science and physics societies, such as APS, AIP, AAAS, to advocate for DEI, immigration, R&D, basic science reform, and other areas that impact HEP.

11.7.6 Engagement with Funding Agencies

Another area of government engagement by the HEP community that needs to be improved is direct communication with the funding agencies, DOE and NSF. There are some communication channels that exist, but there are issues with each that prevent them from adequately serving the community. Foremost among the challenges to open communication is the power dynamic between the funding agencies and individual scientists. Groups like HEPAP and the Community of Visitors are explicitly directed to serve as communication channels between the community and agencies, but their memberships are appointed and skewed toward senior colleagues, presenting somewhat of a barrier to younger colleagues feeling comfortable sharing feedback. This is exacerbated by the fact that HEPAP meetings usually have Congressional and/or Executive government officials in attendance. Meetings between DOE/NSF program managers and individual PIs or groups, as well as grant reviews also provide opportunities for communication, but suffer from lack of participation for early career scientists and concerns that negative feedback could have a negative impact on grant applications. None of these channels offers anonymous communication.
11.8 CEF07: Environmental and Societal Impacts

This topical group focused on ideas and projects related to how particle physics research impacts society and the environment. Examples of impacts on society include collaboration between particle physics research facilities and indigenous communities related with the land host facilities, or ethical usage of software tools in particle physics research. Examples of impacts on the environment range from the local environment of a research facility (pollution, regional development, international visibility, etc.) all the way to the carbon footprints of particle physics research (experiments, facilities, institutions, etc.). Looking at the long time scale of some particle physics experiment proposals, consideration of the implications of climate change and of the various commitments on carbon emissions reductions by host countries is of paramount importance to ensure the success of particle physics research in the future. Ideas and suggestions on all of those issues were encouraged within this topical group.

Ultimately, five contributed papers were developed and submitted this group, on:

- environmental impacts of particle physics [36, 37, 38];
- interactions of different laboratories with their local communities [39];
- non-nuclear proliferation [40].

11.8.1 Environmental Impacts of Particle Physics

Particle physics activities include construction and operation of large-scale facilities, detectors, and computing farms, and travels for various types of physics engagements. Doing particle physics impacts on the environment, and this must be considered in the global context of climate change as discussed in Ref. [36]. Future progress in the field will require the construction of new facilities as discussed in the other frontiers of Snowmass 2021 cite here the reports of the energy, neutrino, cosmic and accelerators frontiers. The environmental impacts of facility constructions to advance particle physics research need to be understood in the global efforts to reduce global warming. The projected carbon impacts of the Future Circular Collider (FCC)—or any similar-scale facility—would be comparable to that of a redevelopment of a major city neighborhood; that level of emission will not go unnoticed. The field needs to invest in carbon reduction R&D and anticipate environmental impact reviews [36]. The green ILC is an effort to include carbon reduction in the design, and later in the construction and operation of this machine; a working group has been organized to study efficient design of ILC components and a sustainable ILC City around the laboratory. Should this machine be constructed, its design will be adapted, in consultation with local authorities, to offset excess carbon emission [37] cite here the CEF07 TG report. In Ref. [38], the necessity for environmental sustainability in the development of next generation accelerators is articulated; energy-efficient components and conceptual designs are focus areas for energy efficiency.
and power consumption in large-scale accelerators. Carbon emissions from greenhouse gases used for detectors and cooling is another area of environmental impact of particle physics activities and mentioned in Ref. [36]. For future particle physics projects, investment in R&D is needed for alternative gases—with low global warming potential—for detector operation and facility cooling, without compromising physics performance. Particle physics research relies on large-scale computing; efforts to mitigate computing-related carbon emission should developed, e.g. by optimizing computing-intensive coding and task scheduling [36].

Greenhouse gas emissions associated to laboratory or university activities are categorized within the scope of direct emissions (from the organization), indirect emissions (electricity, heating, etc.) and other indirect emissions (business travels, commutes, catering, etc.). Across many institutes, much remains to be done to reduce per-capita emissions below the 1 t CO2e per year needed to prevent excessive warming. Travels for physics activities are an essential part of doing particle physics, and aircraft emissions are increasing. It is important to understand which travels are important or necessary and to develop the infrastructures for effective remote engagements. The experiences during the COVID-9 pandemic can serve as guides to optimize in-person versus remote engagements [37] cite here the CEF07 TG report. The following guidelines are advanced to reduce the environmental impacts of particle physics activities.
CEF07 Recommendation 1 – New experiments and facility construction projects should report on their planned emissions and energy usage as part of their environmental assessment which will be part of their evaluation criteria. These reports should be inclusive of all aspects of activities, including construction, detector operations, computing, and researcher activities.

CEF07 Recommendation 2 – US laboratories should be involved in a review across all international laboratories to ascertain whether emissions are reported clearly and in a standardized way. This will also allow other US particle physics research centers (including universities) to use those standards for calculating their emissions across all scopes.

CEF07 Recommendation 3 – Using the reported information as a guide, all participants in particle physics — laboratories, experiments, universities, and individual researchers — should take steps to mitigate their impact on climate change by setting concrete reduction goals and defining pathways to reaching them by means of an open and transparent process involving all relevant members of the community. This may include spending a portion of research time on directly tackling challenges related to climate change in the context of particle physics.

CEF07 Recommendation 4 – US laboratories should invest in the development and affordable deployment of next-generation digital meeting spaces in order to minimize the travel emissions of their users. Moreover the particle physics community should actively promote hybrid or virtual research meetings and travel should be more fairly distributed between junior and senior members of the community. For in-person meetings, the meeting location should be chosen carefully such as to minimize the number of long-distance flights and avoid layovers.

CEF07 Recommendation 5 – Long-term projects should consider the evolving social and economic context, such as the expectation of de-carbonized electricity production by 2040, and the possibility of carbon pricing that will have an impact on total project costs.

CEF07 Recommendation 6 – All US particle physics researchers should actively engage in learning about the climate emergency and about the climate impact of particle-physics research.

CEF07 Recommendation 7 – The US particle physics community should promote and publicize their actions surrounding the climate emergency to the general public and other scientific communities.

CEF07 Recommendation 8 – The US particle physics community and funding agencies should engage with the broader international community to collectively reduce emissions.
11.8.2 Impact on Local Communities

Physics engagement with local communities is important to build relations and draw long-lasting community support for particle projects and activities; as noted in Section 11.6, successful and impactful engagements should be foundational rather than transactional. In Ref. [39], local community engagement efforts of three laboratories are studied, namely Lawrence Berkeley National Laboratory (Berkeley Lab), Fermi National Accelerator Laboratory (Fermilab), and the Sanford Underground Research Facility (SURF). These laboratories have different local environments, from urban (Berkeley Lab), to suburban (Fermilab), to rural (SURF). In all the three cases, foundational local engagements that promote diversity, communication and lasting relationships, are shown to be mutually beneficial to the community and the laboratory. We propose the following recommendations for foundational engagements between laboratories and their surrounding communities.

CEF07 Recommendation 9 – Laboratories should engage with their local communities in order to create awareness about their work and build lasting, positive relationships.

Community engagement plays an essential role in local decision-making, building relationships, and important discussions about the implementation of key projects. Large particle physics projects funded by the US Government require an evaluation and mitigation of each project’s potential impacts on the local communities. In addition to satisfying governmental requirements, working alongside their local communities can foster lasting change that broadens the positive societal impacts of particle physics research.

CEF07 Recommendation 10 – Laboratories should have consistent outreach and engagement efforts that provide regular opportunities for feedback to help establish trust.

Through its Community Advisory Board, Fermilab offered regularly scheduled meetings to gain feedback from local communities. In addition, SURF ensured its communication with stakeholders at Isna Wica Owayawa was consistent and persistent in order to overcome scheduling and other barriers.

CEF07 Recommendation 11 – Laboratories should promote diversity of membership and collaborative efforts in their outreach initiatives to bring a variety of perspectives to the table and create a better end project.

SURF’s work with tribal elders and other leaders in its local community helps ensure perspectives of indigenous populations in the region are represented and reflected in the work of the Sacred Circle Garden. Meanwhile, Fermilab regularly refreshes and expands its CAB membership to ensure it remains representative of the diversity of its suburban area.

CEF07 Recommendation 12 – Laboratories should avoid transactional relationships when developing relationships with stakeholders, and instead focus on approaches that provide value to each entity.

Laboratories will be best served by making an extended commitment to working with collaborators over an extended period of time, rather than one-time interactions. Opportunities to receive feedback and consider changes can have lasting impacts on the collaborative efforts. SURF has continued to see improvement in program outcomes with Isna Wica Owayawa using this approach. Berkeley Lab has seen success by utilizing small investments in staff time, small-scale donations, and other resources as a launch pad for
lasting collaborations with organizations with shared goals and values.

CEF07 Recommendation 13 – Laboratories should utilize methods that promote honest, two-way communication when engaging in collaborative efforts with stakeholders.

All three case studies exemplify the benefits of open communication. The CAB at Fermilab creates a space where local community members and the lab are able to air concerns and discuss solutions. Berkeley Lab ensures that its community engagement interactions provide a space for members of the community and partners to voice their opinions, while Berkeley Lab listens and reflects on the opinions shared. Finally, SURF seeks indigenous perspectives although in some instances, the resulting dialogue can result in uncomfortable conversations. However, by promoting difficult conversations in a safe environment, SURF was able to promote a design for its ethnobotanical garden that was approved by all involved.

11.8.3 Impact on Nuclear Non-proliferation

Detector technologies for neutrino physics can find applications—or benefit from R&D—in nuclear non-proliferation where detection of reactor anti-neutrinos offer promising reactor monitoring systems that can be remotely operated, robust, non-intrusive and persistent. These ideas are explored in Ref. [40] and the following recommendations are advanced.

CEF07 Recommendation 14 – The High Energy Physics community should continue to engage in a natural synergy in research activities into next-generation large scale water and scintillator neutrino detectors, now being studied for remote reactor monitoring, discovery and exclusion applications in cooperative nonproliferation contexts.

CEF07 Recommendation 15 – Examples of ongoing synergistic work at US national laboratories and universities should continue and be expanded upon.

These include prototype gadolinium-doped water and water-based and opaque scintillator test-beds and demonstrators, extensive testing and industry partnerships related to large area fast position-sensitive photomultiplier tubes, and the development of concepts for a possible underground kiloton-scale water-based detector for reactor monitoring and technology demonstrations.

CEF07 Recommendation 16 – Opportunities for engagement between the particle physics and nonproliferation communities should be encouraged.

Examples include the bi-annual Applied Antineutrino Physics conferences, collaboration with US national laboratories engaging in this research, and occasional NNSA funding opportunities supporting a blend of nonproliferation and basic science R&D, directed at the US academic community.
11.8.4 Links with Other Topical groups

This topical group is interlinked with other Community Engagement Frontier topical groups. For example, the impacts on society include issues involving inclusion and diversity and the impacts on the environment and the sustainability of the field involve components associated with the applications and industry topical group.

11.9 Conclusions

During Snowmass 2021, participants in the Community Engagement Frontier have attempted to address the importance of engaging members of various communities to generate support for and sustainability of high energy physics. The CEF efforts were organized into seven topical groups and connections with the other Snowmass frontiers were established through frontier liaisons to exchange feedback. Each CEF topical group studied specific focus areas of engagement and their importance to society and the future of our field. The focus areas were Applications and Industry, Career Pipeline and Development, Diversity, Equity and Inclusion, Physics Education, Public Education and Outreach, Public Policy and Government Engagement, and Environmental and Societal Impacts. Topical groups collected and studied inputs from letters of interest, surveys, town hall meetings, workshops, invited expert discussions, and regular working group meetings. These efforts produced thirty-five contributed papers and seven topical group reports containing recommendations to improve engagement between HEP and related communities. A few ideas that were not developed into contributed papers because of lack of person-power are nevertheless noted in the texts. To facilitate maximum impact and efficiency of implementation, the suggested recommendations for action have been directed to different entities within the HEP community, namely government and funding agencies, academic and research institutions, research collaborations, professional societies and individual physicists, and have been organized into overall goals categorized by five target communities for engagement.

We, the topical group and frontier conveners of CEF, lament the persistently low participation in community engagement. Regrettably, regardless of efforts throughout Snowmass 2021 to motivate participation on cross-cutting CEF issues, the work in this frontier was carried out by a relatively small number of colleagues, most of whom are physicists who also had interests in other physics frontiers that they were largely unable to pursue. Various reasons, some quite understandable, have been advanced to explain this lack of interest. However, until due importance is given to community engagement efforts and mechanisms are implemented for support, encouragement and rewards, no meaningful progress will be achieved in spite of expressed well-meaning intentions. We call upon each specified entities’ members that are serious about improving HEP community engagement to take ownership of the CEF recommendations and act on their implementation within structures developed to foster and gauge progress. We hope that at the next Snowmass, we do not find a repeat of a decade’s inaction on these issues, but rather we inherit a vibrant program of HEP community engagement on which to build.

Acknowledgements

We appreciate the assistance of Daria Wang (ORISE) in the planning and management of CEF efforts. We thank Alan Stone (DOE Office of Science) for support. We express our appreciation for all of the people that contributed to CEF efforts, e.g. the DPF chair line for support, the authors of contributed papers, the topical experts that shared their thoughts and experiences, the liaisons that helped maintain channels.
of communications with other frontiers, and the topical group and frontier conveners who carried the heavy loads so diligently and efficiently.
